

ABSTRACT

A measuring unit is removably connected to a sample analyzer. The measuring unit includes a first member having a first channel through which a sample is allowed to pass, a second
5 member having a second channel through which the sample is allowed to pass, and a partition member having a through-hole through which the sample is allowed to pass from the first channel to the second channel. The partition member includes a base having the through-hole and a projecting portion which projects
10 from the base around the through-hole.
